

## Laser Scanning and Ozone Treatment

- ◇ 75% of early decay in teeth cannot be diagnosed by a visual examination or when radiographs are taken.
- ◇ We now have the technology to **detect** and **heal** tooth decay.
- ◇ Detection is carried out by scanning using laser fluorescence.
- ◇ Treatment is provided with '**Ozone**' in the dental surgery followed by using a new fluoride preparation at home.
- ◇ Both are simple **painless** procedures which do not require injections, drilling or fillings.
- ◇ If your family would like to benefit from this latest technology please tell your dentist.
